1 Introduction

This User Guide continues where the QuickStart Guide documentation ended by providing additional hardware details about the Zoom OMAP-L138 eXperimenter Kit, as well as introductory instructions for using Code Composer Studio and the included Board Support Library (BSL) files.

1.1 Scope of Document

- This User Guide references specific connectors on the application baseboard. However, the discussion is limited to special use instructions; detailed information about the connectors should be referenced on the respective schematic and Bill of Material (BOM) documents. See Appendix A for links to these documents.
- This User Guide does not provide detailed instructions for the software included with the eXperimenter Kit. Please refer to the specific User Guides for each respective software product for additional information. A list of additional documentation is available in Appendix A.

1.2 Requirements

- It is assumed that the QuickStart Guide has been read in its entirety. See Appendix A for a link to the QuickStart Guide.
- A host PC with CD/DVD drive, USB port, and at least 2 GB of hard drive space.

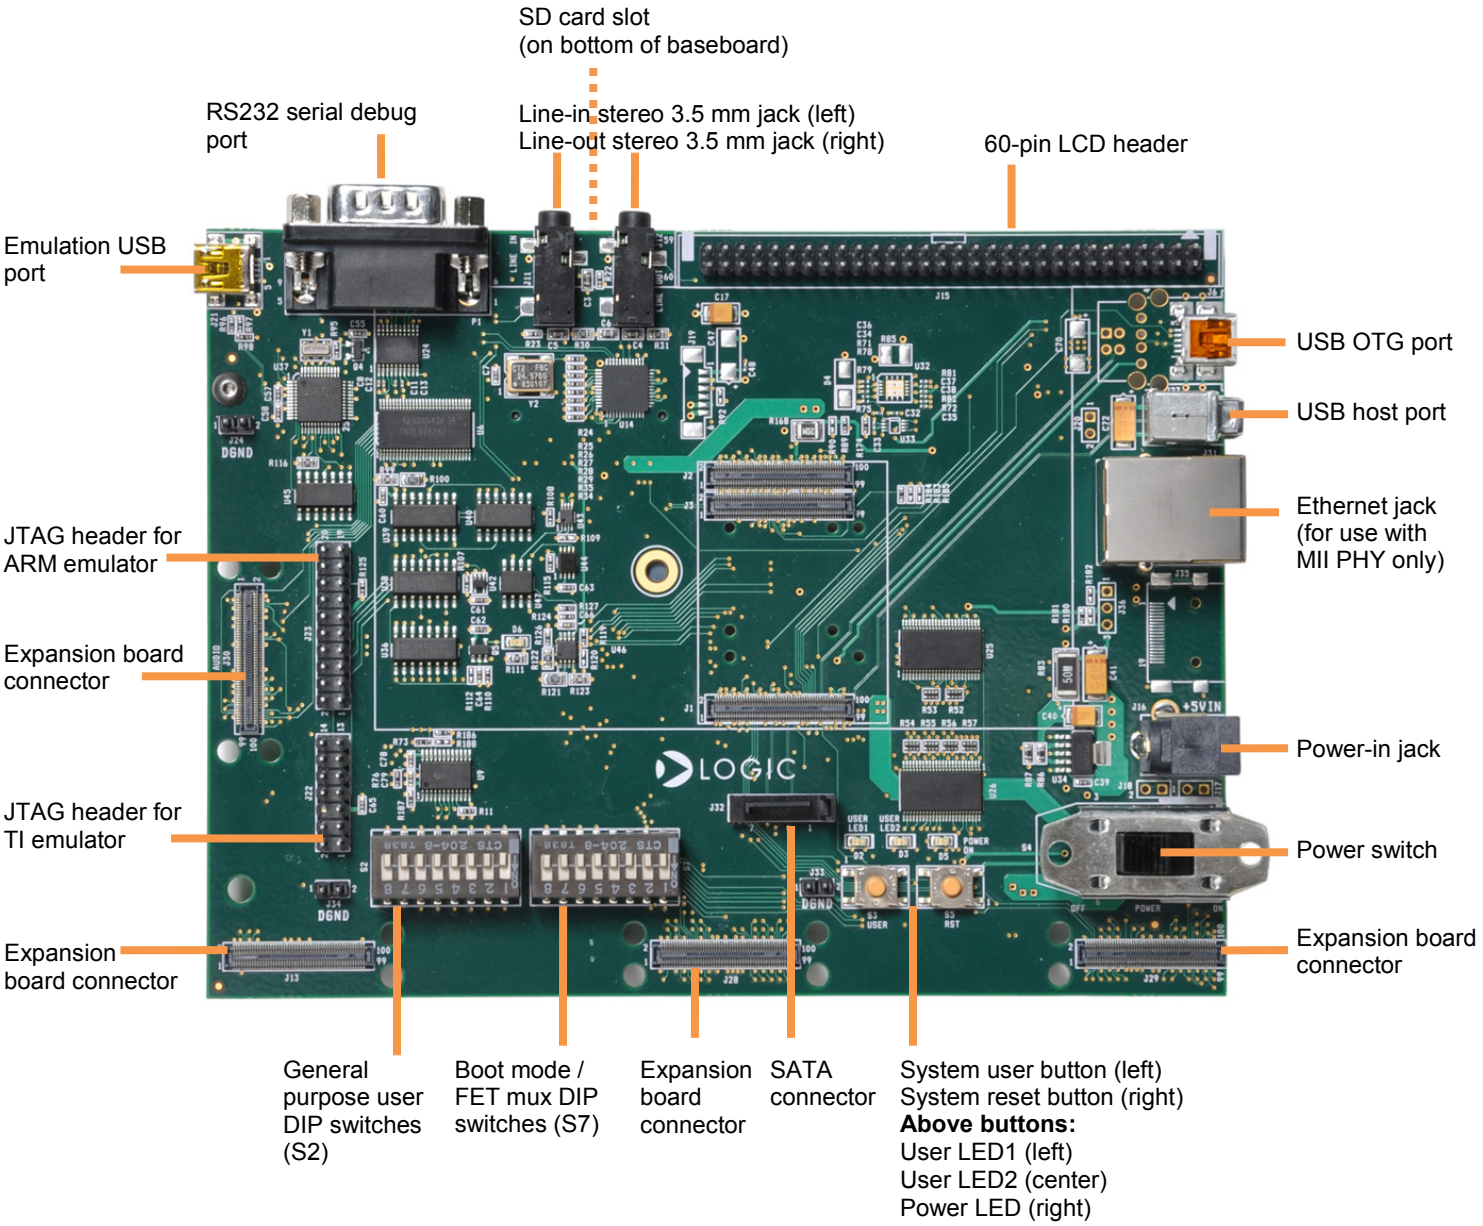
2 Application Baseboard

2.1 Application Baseboard Features Diagram



2.2 Application Baseboard Ethernet Jack

The Ethernet jack located on the application baseboard is to only be used with the MII PHY; whereas the Ethernet jack located on the UI board is to be used only with the RMII PHY. The Ethernet controller on the CPU can only talk to one Ethernet PHY at a time. Which Ethernet PHY is being used is entirely controlled through software.

2.3 DIP Switches

There are two 8-position DIP switches located on the application baseboard at reference designators S2 and S7. By default, all of the switches are set to the “OFF” position.

 Logic Product Development Company, All Rights Reserved

The S2 DIP switch is reserved for user application general purpose. The S7 DIP switch controls the processor's boot mode and several FET muxes on the baseboard. Table 2.1 describes the function of each switch.

Table 2.1: S7 DIP Switch Functions

Switch	OFF Position	ON Position
S7:1*	Baseboard LCD drive enabled.	Baseboard LCD drive disabled.
S7:2	Baseboard audio enabled. Associated McASP lines connect to baseboard audio only.	Baseboard audio disabled. Associated McASP lines are available on audio expansion connector.
S7:3	OMAP-L138 I/O runs at 3.3V	OMAP-L138 I/O runs at 1.8V
S7:4	No connection	
S7:5	BOOT[1]	
S7:6	BOOT[2]	
S7:7	BOOT[3]	
S7:8	BOOT[4]	

***Note:** S7:1 indicates slide 1 on the S7 DIP switch, S7:2 indicates slide 2 on the S7 DIP switch, and so on.

A default boot mode has been defined by pulling all boot pins (BOOT[0:7]) to a default state on the SOM. The default boot mode is SPI1 Flash; all available boot modes are described in Table 2.2.

Table 2.2: S7 DIP Switch Boot Modes

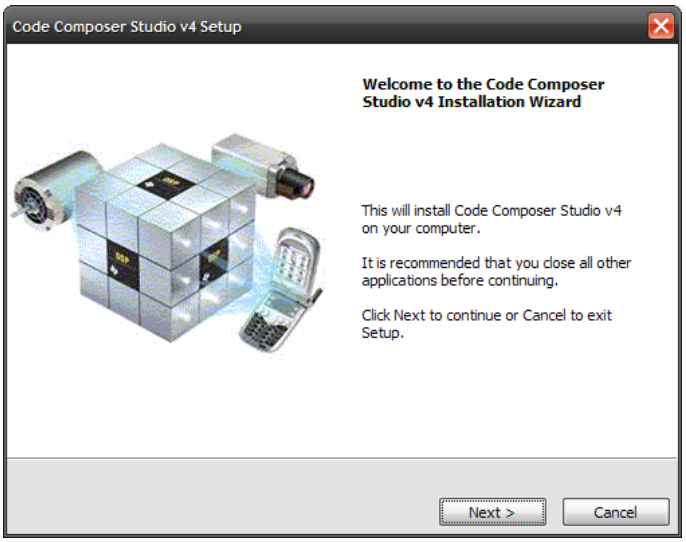
		DIP Switch Setting—S7[5:8]			
		BOOT[4]	BOOT[3]	BOOT[2]	BOOT[1]
	Boot Mode	S7:8	S7:7	S7:6	S7:5
	NOR EMIFA	OFF	ON	ON	ON
	NAND-8 EMIFA	OFF	OFF	OFF	ON
Default	SPI1 Flash	OFF	OFF	OFF	OFF
	UART2	ON	ON	OFF	OFF
	EMU Debug	ON	OFF	OFF	ON

3 Installing Code Composer Studio

The Zoom OMAP-L138 eXperimenter Kit includes a software DVD containing Code Composer Studio (CCStudio).

1. Insert the Code Composer Studio v4 software DVD into your host PC.
2. Navigate to the DVD drive and open the files on the CCStudio DVD. Double-click on *setup_CCS_4.2.x.xxxxx.exe* and a splash screen similar to the image below will appear. Click the **Next** button.

 Logic Product Development Company, All Rights Reserved



3. Follow the on screen instructions until you arrive at the screen for Product Configuration, select **Platinum Edition**.
4. On the next screen, leave the default ISA items checked. Click the **Next** button.
5. Click the **Next** button to start copying files.
6. Wait for CCStudio to finish installing; this process can take some time, so please be patient.
7. Click the **Finish** button when the installation is complete. You may eject the CCStudio DVD at this time.

4 Running Board Support Library (BSL) Sample Programs

The BSL sample programs are included to test the different features of the development kit and diagnose any potential problems. In order to run these tests, you first have to connect your development kit to a PC.

4.1 Copy BSL Files to PC

Both SD cards included with the OMAP-L138 eXperimenter Kit contain the GEL and BSL files. These files need to be copied to your host PC.

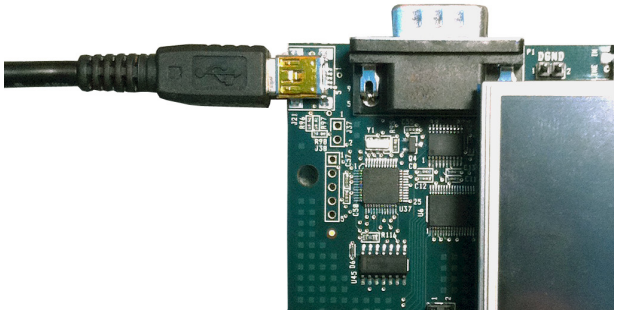
1. Navigate into the SD card and locate the *BSL* directory.
2. Extract the ZIP archive and save the files to your host PC. (**NOTE:** The files may be placed anywhere on your host PC; however, the original file structure must remain intact.)
3. For the instructions in this User Guide, it is assumed the files were copied to the root C:\ drive. For example:

   C:\OMAP-L138_GEL_BSL_Files_v2.3
   C:\TMS320C6748_GEL_BSL_Files_v2.3

4.2 Connect eXperimenter Kit to Host PC

To communicate with the OMAP-L138 eXperimenter Kit using CCStudio, you will need to connect the included USB A to mini-B cable to the USB emulator port on the application baseboard and your host PC.

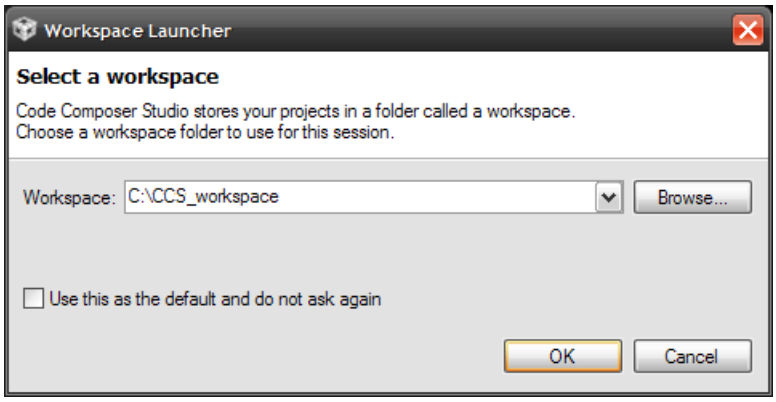
 Logic Product Development Company, All Rights Reserved



As soon as the USB cable connects to your host PC, Windows should automatically recognize that new hardware has been connected and install the necessary drivers. Power on your OMAP-L138 eXperimenter Kit and continue with the next section.

4.3 Launch Code Composer Studio

1. Launch Code Composer Studio by selecting **Start Menu > All Programs > Texas Instruments > Code Composer Studio v4.2.0 > Code Composer Studio v4**.
2. Select a workspace location and then click the **OK** button.



3. CCStudio will finish launching and a Welcome to Code Composer Studio window will open. (**NOTE:** If you do not have the latest Adobe Flash Player installed on your machine, you will be prompted to install. This is required for proper viewing of the Code Composer Studio Welcome screen.)
4. If you do not have a license, select the **Activate a License** option and click the **Use Free Limited License** button. (**NOTE:** If you do not have an active Internet connection, you can select to Evaluate Code Composer Studio for 30 days. At any time during that period, you can change to the Free Limited License by selecting **Help > License Options...** from the CCStudio menu bar and then following the onscreen instructions.)

 Logic Product Development Company, All Rights Reserved

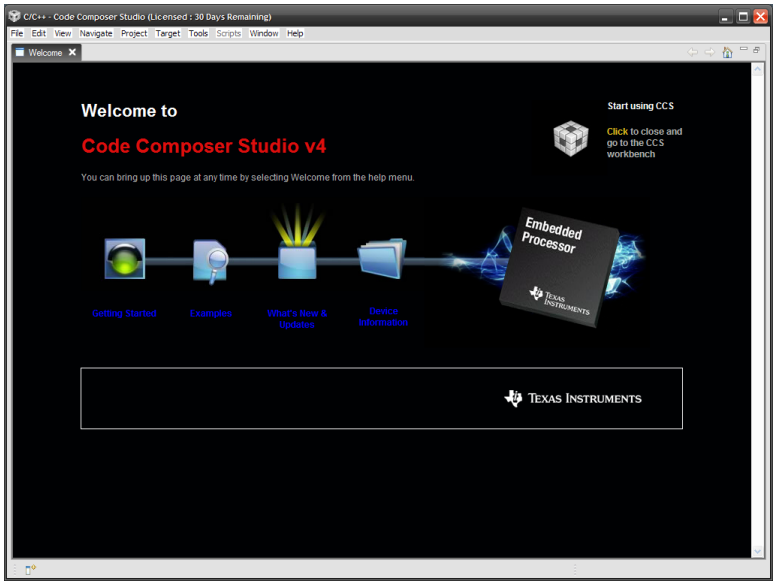
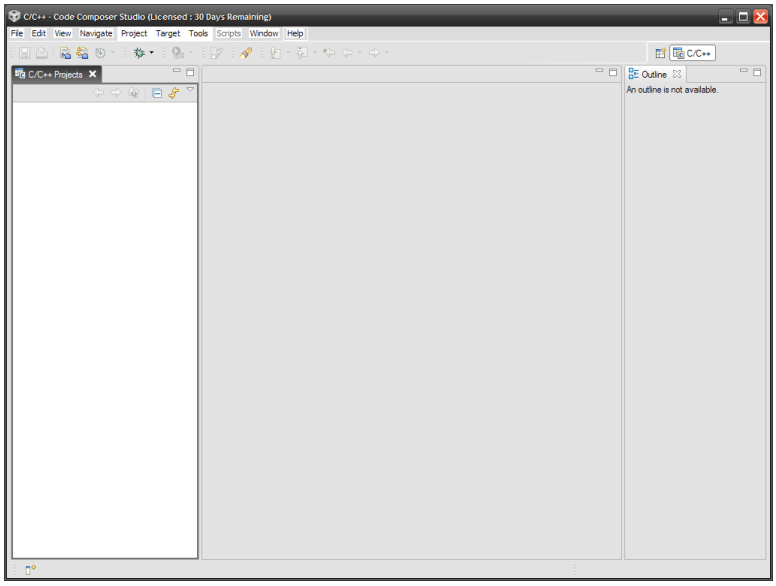
5. You will be redirected to TI's website to login in with your myTI.com account. Follow all the online instructions. After completing the online instructions, you will receive an email containing an attachment that is your license file.
6. Save the license file to your host PC, then return to the Welcome to Code Composer Studio window and under *Step 2 - Install License File*, browse to where you saved the license file. Click the **OK** button.
7. You will then be presented with the Code Composer Studio Welcome screen. Click on the cube in the upper right-hand corner to go to the CCStudio workbench.



8. The CCStudio workbench will then appear.

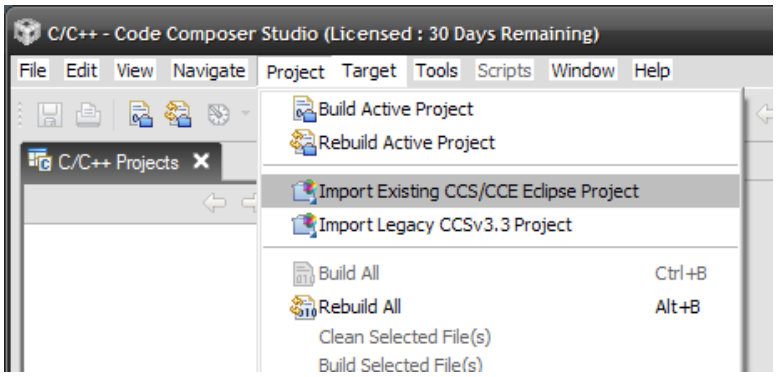


4.4 Run Sample Test

As an example, we will run one feature test. In order to run a test program, you will have to select the program, compile (or build) the program, and then load the compiled program. The following steps will walk you through that process.

 Logic Product Development Company, All Rights Reserved

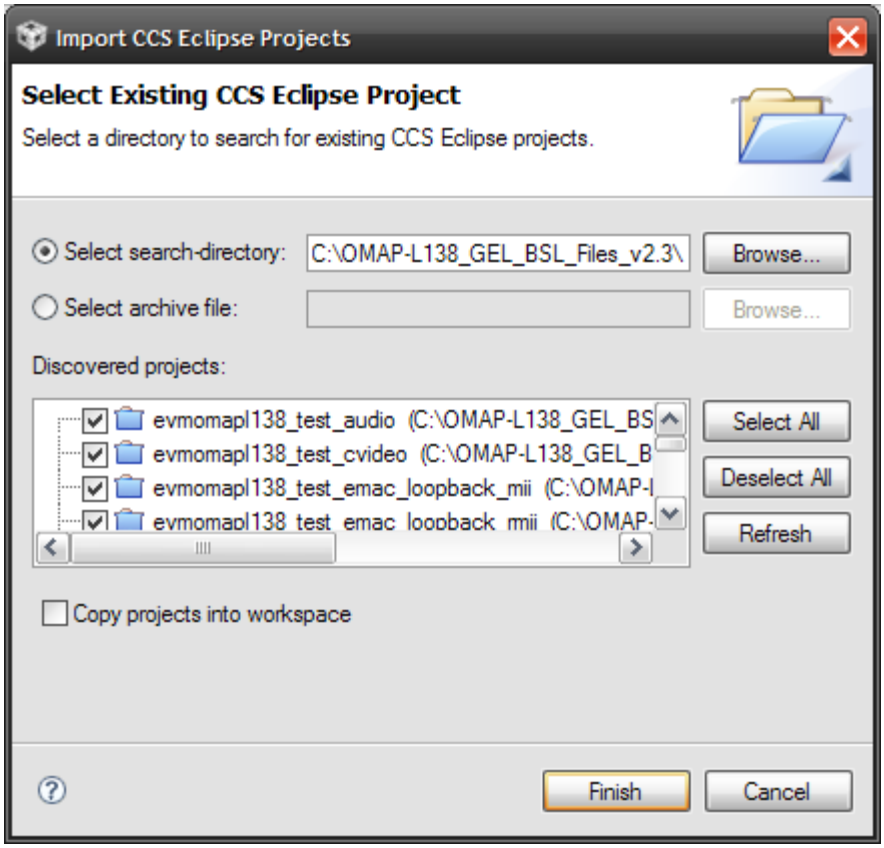
1. From the menu bar, select **Project > Import Existing CCS/CCE Eclipse Project**.



2. Browse to the location where you saved the BSL files on your host PC and down to the *OMAP-L138_GEL_BSL_Files_v2.3\bsl* directory. Click the **OK** button. Verify the correct project exists in the *Discovered projects:* window and then click the **Finish** button.

 Logic Product Development Company, All Rights Reserved

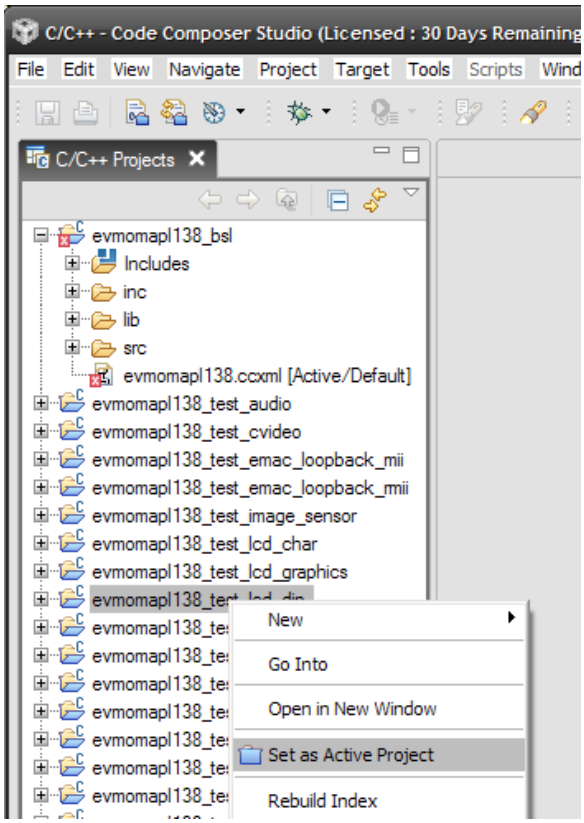
3. Once again, select **Project > Import Existing CCS/CCE Eclipse Project**. This time browse to the tests folder, *OMAP-L138_GEL_BSL_v2.3\tests\experimenter*. Click the **OK** button. Verify the correct project exists in the *Discovered projects:* window and then click the **Finish** button.



4. In the Projects window on the left, expand the *evmomapl138_bsl* folder and verify the .ccxml file is set as Active/Default. If not, right-click on the .ccxml file name and select **Set as Active Target Configuration**, then repeat to also **Set as Default Target Configuration**.

 Logic Product Development Company, All Rights Reserved

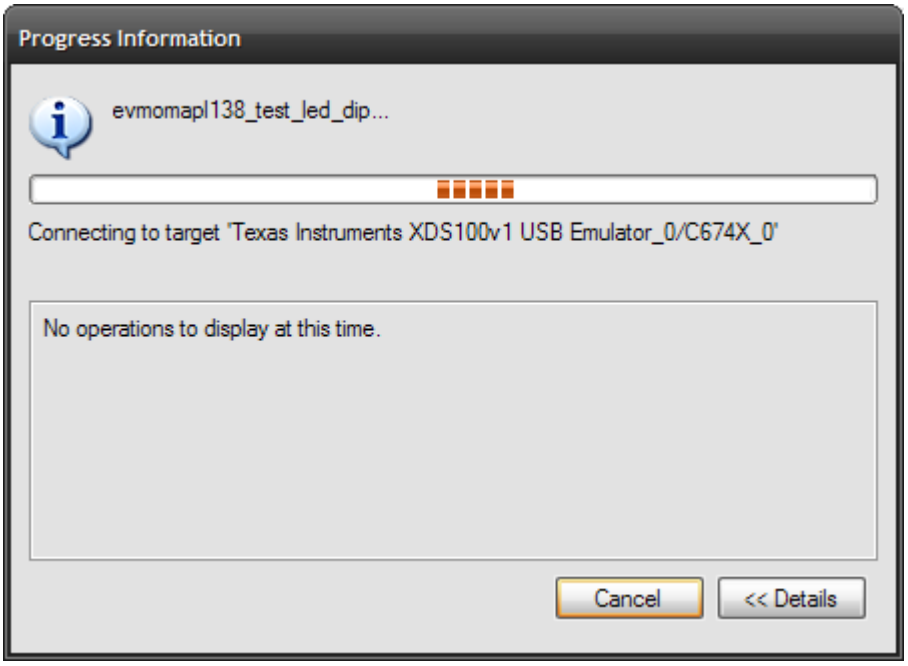
5. Once again in the Projects window on the left, expand the *evmomapl138_test_led_dip* project. Right-click on the file name and select **Set as Active Project**.



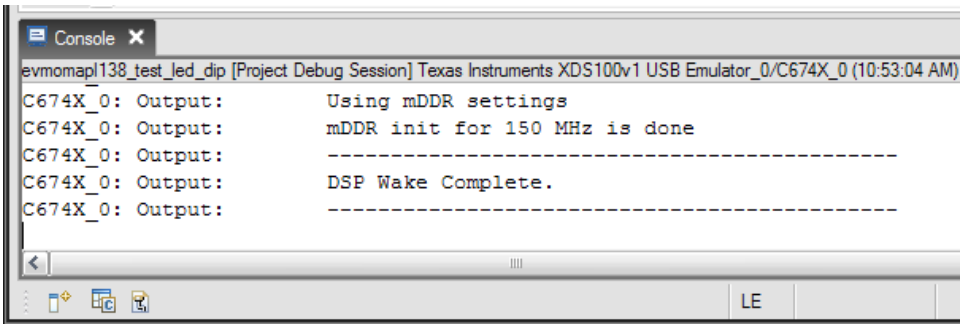
6. The test must now be compiled; from the CCStudio menu bar select **Project > Build Active Project**.

 Logic Product Development Company, All Rights Reserved

7. Once the Console window prints the message “Build Complete,” select **Target > Debug Active Project** from the menu bar. (**NOTE:** If you receive a message stating “Error connecting to the target,” press the reset button on the baseboard and then click **Retry**.)



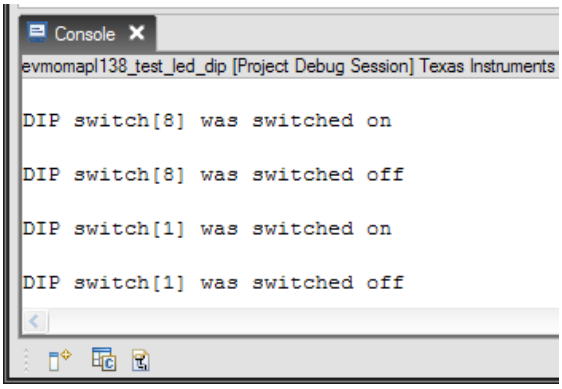
8. After the test finishes debugging, you will see a message in the Console window stating “DSP Wake Complete.”



9. To run the program, select **Target > Run** from the menu bar.

 Logic Product Development Company, All Rights Reserved

10. The Console window provides a brief description of the test. If you move any of the S2 DIP switches, output text will print the switch that was moved and its new position (ON or OFF) and USER LED1 or USER LED2 will turn on or off in relation to the DIP switch position.



The steps in this section can be repeated to run any of the other tests for your eXperimenter Kit. (**NOTE:** All of the tests in the “experimenter” folder can be run on both the OMAP-L138 EVM and eXperimenter Kit; the tests in the “evm” folder can only be run on the OMAP-L138 EVM.)
